

Modelling and Analysis of Canada's Greenhouse Gas Emissions (1991-92)

Client: Environment Canada - Pollution Data Analysis Division

SGA developed an interactive, user-friendly, menu-driven spreadsheet program for the estimation of GHG emissions from energy and non-energy sources on a provincial basis. Energy emissions were estimated from the import of Statistics Canada energy use data. For the next years this program was the basis for calculating the Canadian National GHG Inventory.

Publication: User's Manual for the Environment Canada Greenhouse Gas Inventory Program, Environment Canada, 1992
