

Monitoring of Photovoltaic-Genset Hybrid Power Systems (2000)

Client: Natural Resources Canada - CANMET Energy Diversification Research Laboratory (CEDRL)

SGA coordinated the monitoring of PV-genset hybrid power systems for NRCan. We identified and evaluated pilot sites for a three-year monitoring program. As part of the program we:

- Designed a monitoring plan, including specification of instrumentation and analysis of costs.
- Installed monitoring equipment at two remote sites: a telecoms repeater station and a park service facility.
